Executive Summary

The Independent Hospital Pricing Authority (IHPA) is responsible for the development of the Australian Refined Diagnosis Related Groups (AR-DRGs) classification. AR-DRGs group together treatments and services provided for admitted acute care to enable hospitals to be funded for these services using Activity Based Funding (ABF) arrangements. This is the first time since IHPA was established and assumed responsibility for the AR-DRG classification that development of a new version has been undertaken within the agency.

AR-DRG Version (V) 10.0 has been finalised following clinical and statistical analysis and in consultation with clinicians, jurisdictions and other health sector stakeholders. This report outlines the changes made for AR-DRG V10.0 and details the refinement process undertaken and the rationale for changes.

Refinement and review of the stability of the AR-DRG complexity model was identified by stakeholders as the highest priority for AR-DRG V10.0 to ensure that it is robust and fit for purpose. As a result the major focus for V10.0 has been to review the diagnosis exclusions within the complexity model and its overall stability. Alongside this other changes have been informed by public submissions and development work held over from AR-DRG V9.0. IHPA has also undertaken a comprehensive review of the splitting of end classes and implemented changes resulting from a review of the intervention hierarchy.

AR-DRG V10.0 is anticipated to be released in mid-2019 and used to price admitted acute episodes of care from 1 July 2020.

1 Introduction

1.1 Australian Refined Diagnosis Related Groups

IHPA has responsibility for the development of the AR-DRG classification, which groups together treatments and services provided for admitted acute care to enable hospitals to be funded for these services using ABF arrangements. The AR-DRG classification is underpinned by the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM), the Australian Classification of Health Interventions (ACHI) and the Australian Coding Standards (ACS); collectively known as ICD-10-AM/ACHI/ACS.

All public and private hospitals in Australia use ICD-10-AM/ACHI/ACS and AR-DRGs to classify admitted acute care and the classifications are updated every two years to ensure they are fit for purpose and remain clinically current.

The AR-DRG classification consists of approximately 800 end classes, with each admitted acute episode of care being classified based on diagnoses, interventions and other routinely collected data, such as age, sex, mode of separation, length of stay, newborn admission weight and hours of mechanical ventilation. While the AR-DRG classification is instrumental to ABF, it is also used for many other purposes including performance management, benchmarking, epidemiology and research.

Development of AR-DRG V10.0 has been undertaken by IHPA in-house while the development of ICD-10-AM/ACHI/ACS has continued to be contracted to the Australian Consortium for Classification Development (ACCD) for Eleventh Edition. The classifications have been developed in consultation with clinicians, jurisdictions and other health sector stakeholders.

It is anticipated that AR-DRG V10.0 will be released in mid-2019 and used to price admitted acute episodes of care from 1 July 2020. ICD-10-AM/ACHI/ACS Eleventh Edition will be implemented on 1 July 2019.

1.2 Classification process

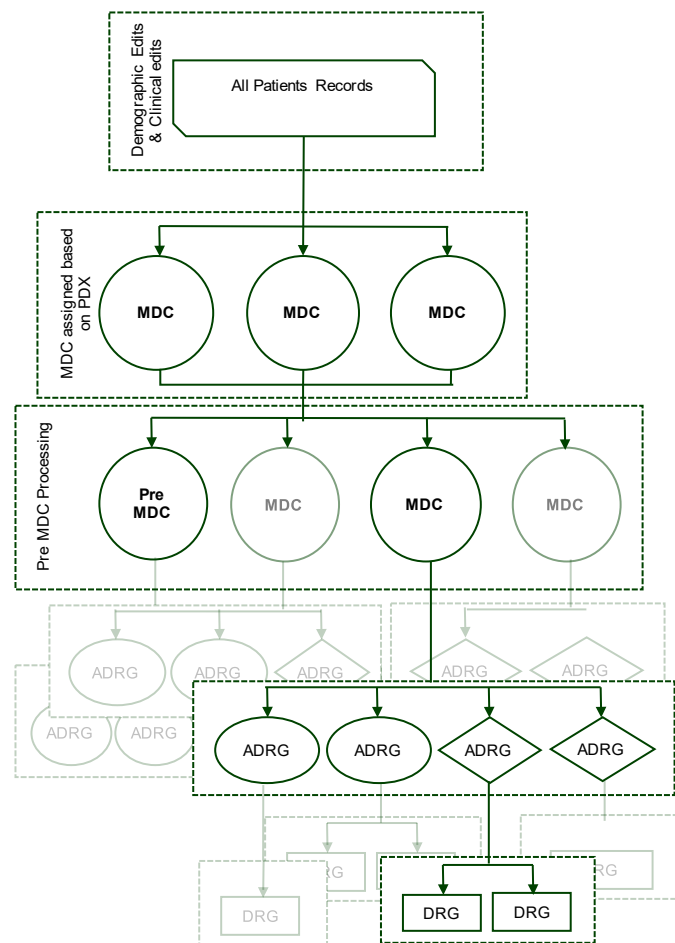

The process of classifying or 'coding' involves the translation of information (diagnoses and interventions) from the clinical record of a patient into alphanumeric codes within ICD-10-AM and ACHI.

At the conclusion of a patient's episode of care a clinical coder reviews the patient's clinical record (the primary source for the coding of acute admitted episodes of care) and abstracts information recorded by clinicians to assign codes for the principal diagnosis, additional diagnoses and interventions performed in accordance with guidelines provided in the ACS.

Following assignment of ICD-10-AM and ACHI codes episodes of care are assigned to a DRG in the AR-DRG classification. AR-DRGs group episodes of care with similar diagnoses and intervention codes. This process of assigning episodes of care to a DRG is a complex process and is carried out using software that contains the AR-DRG algorithms (often referred to as the 'Grouper').

A schematic of the AR-DRG assignment process is at Figure 1.

Figure 1: Schematic diagram for AR-DRG V10.0 assignment

- Demographic and clinical edits:** These edits check the validity of the data to be used for grouping; and include age, sex, neonatal admission weight, sameday status, hours of mechanical ventilation and mode of separation. They also validate all diagnosis (ICD-10-AM) and intervention (ACHI) codes, combined with a patient's age and sex. Principal diagnosis is also checked to validate that it is an acceptable principal diagnosis code. Potential issues in relation to the validity of the data may result in assignment to one of the three error ADRGs:

 - 960Z *Ungroupable*;
 - 961Z *Unacceptable Principal Diagnosis*;
 - 963Z *Neonatal Diagnosis Not Consistent W Age/Weight*.
- MDC assignment:** After edit processing episodes are assigned to a Major Diagnostic Category (MDC) according to principal diagnosis, and are generally mutually exclusive.
- Pre MDC processing:** Episodes are then assessed as to whether they meet Pre MDC criteria that identifies very high cost episodes (e.g. A13 *Ventilation* ≥ 336 hours) and is driven by a specific intervention code that overrides the outcome of the principal diagnosis based MDC assignment.
- ADRG assignment:** Episodes are assigned to an Adjacent DRG (ADRG) mostly according to diagnosis and intervention codes. All MDCs have a hierarchical structure that separates the ADRGs into either the intervention or medical partition.

- **DRG assignment:** Within each ADRG episodes are then assigned to DRGs according to a complexity measure that quantifies relative levels of resource utilisation within each ADRG and is used to split ADRGs into different DRG levels on the basis of resource homogeneity.

1.3 Episode clinical complexity

The AR-DRG classification has a measure in place to account for the complexity of patient episodes. A patient episode of care is initially assigned to an ADRG. An ADRG is a group of DRGs which have the same first three characters (for example B70 *Stroke and Other Cerebrovascular Disorders*). They broadly group episodes with the same diagnosis and intervention codes together. ADRGs are then subdivided into individual DRGs based on a complexity measure and occasionally other factors such as length of stay. DRGs ending in 'A' will be the most costly whereas DRGs ending in 'D' will be the least costly. For example:

- B70A *Stroke and Other Cerebrovascular Disorders, Major Complexity;*
- B70B *Stroke and Other Cerebrovascular Disorders, Intermediate Complexity;*
- B70C *Stroke and Other Cerebrovascular Disorders, Minor Complexity;*
- B70D *Stroke and Other Cerebrovascular Disorders, Transferred < 5 days.*

AR-DRG V8.0 introduced a new methodology for determining clinical complexity, known as the Episode Clinical Complexity (ECC) Model. The Episode Clinical Complexity Score (ECCS) quantifies relative levels of resource utilisation within each ADRG and is used to split ADRGs into different DRG levels on the basis of resource homogeneity.

The process of deriving an ECCS for each episode begins by assigning a Diagnosis Complexity Level (DCL) value to each diagnosis reported for the episode. DCLs are integers that quantify levels of resource utilisation associated with each diagnosis, relative to levels within the ADRG to which the episode belongs. DCL values are assigned to principal diagnosis and additional diagnosis codes and range between zero and five. A DCL value of zero indicates the diagnosis has no effect on complexity within that specific ADRG. Approximately 11,000 diagnosis codes have a DCL with a non-zero value in AR-DRG V10.0, i.e. they contribute to the complexity of an episode of care.

The ECCS determines the final DRG an episode of care is assigned to within an ADRG. For example, to be assigned to DRG B70A *Stroke and Other Cerebrovascular Disorders, Major Complexity*, an episode must have an ECCS greater than or equal to 4.0 (in AR-DRG V10.0).

The AR-DRG V10.0 Technical Specifications provide further information with regards to the ECC model and ECCS derivations.

1.4 Governance and consultation process

IHPA has a number of technical groups to ensure consultation with a wide range of stakeholders as well as a clear governance process for endorsing changes to both ICD-10-AM/ACHI/ACS and AR-DRGs. IHPA has two groups which provide clinical and technical advice in regard to the refinement and development of AR-DRGs:

- Classifications Clinical Advisory Group (CCAG) – provide clinical advice and facilitate broad canvassing of clinicians to ensure that there is likely to be general acceptance of the developed proposals. Membership includes representation from medical, nursing and allied health professions. The group has two representatives from IHPA's Clinical Advisory Committee (CAC).

- Diagnosis Related Groups Technical Group (DTG) – provide advice in regard to the refinement and development of AR-DRGs. DTG includes representatives from state and territory health departments, the Commonwealth, private hospitals, private health insurers and the New Zealand Ministry of Health.

CCAG and DTG advice was sought on all AR-DRG V10.0 refinements. A sub-group of CCAG clinicians also provided extensive advice in relation to the proposed diagnosis exclusions within the AR-DRG complexity model. See [3.1 Refinements to diagnosis exclusions](#).

Consultation on refinements to the AR-DRG classification also occurs through IHPA's CAC, Technical Advisory Committee, Jurisdictional Advisory Committee and Stakeholder Advisory Committee with final approval sought from the Pricing Authority.

In addition to consultation through the advisory groups, IHPA undertook a public consultation in May/June 2018 on major refinements to be introduced in AR-DRG V10.0 to ensure the broadest possible consultation across the public and private health sector. Fifteen submissions were received and all submissions are published on IHPA's website (except if specified as commercial in confidence). IHPA has responded to each submission individually.

1.5 Other documents

In addition to the AR-DRG V10.0 Final Report other reference documents have been developed to support AR-DRG V10.0:

- AR-DRG V10.0 Technical Specifications;
- AR-DRG V10.0 Definitions Manuals.

1.5.1 AR-DRG V10.0 Technical Specifications:

This document accompanies the AR-DRG V10.0 Final Report. It provides the methodology and technical specifications used in developing AR-DRG V10.0 including:

- Data preparation and modification;
- Derivation of the ECCS;
- ADRG splitting review;
- ADRG hierarchy review.

1.5.2 AR-DRG V10.0 Definitions Manuals

The AR-DRG Definitions Manuals are reference documents that detail the definition logic for the DRG process performed by the grouper. The manuals provide documentation of how particular episodes of care group to particular DRGs. While the manuals assist with the identification of likely DRG assignments for individual episodes, they are not a substitute for the grouping software that is provided by various vendors under licence from IHPA.

2 Development of Work Program

IHPA drafted a work program in late 2017 outlining areas for consideration in the development of AR-DRG V10.0 and to identify other areas stakeholders considered to be a priority. This work program was approved through IHPA's technical and advisory committees in early 2018 with tasks sourced from a number of areas, including:

- Issues held over from AR-DRG V9.0 development;
- Areas identified through IHPA's pricing work;
- Submissions from stakeholders to consultations on the annual Pricing Framework for Australian Public Hospital Services;
- AR-DRG public submissions.

Refinement and review of the stability of the AR-DRG complexity model was identified as the highest priority for AR-DRG V10.0 to ensure that it is robust and fit for purpose.

The work program was reviewed by IHPA's advisory committees and a list of priorities for AR-DRG V10.0 was finalised.

3 Refinement of AR-DRG Version 10.0

3.1 Refinements to diagnosis exclusions

A number of diagnosis codes are excluded from consideration in the AR-DRG ECC Model based on guiding principles formalised during its initial development (V8.0). These guiding principles aimed to characterise the scope of the model in terms of diagnoses considered relevant for DRG classification purposes.

Clinical determination of exclusions for all (approximately) 16,000 diagnosis codes was not possible during the development of the complexity model for V8.0, however, it was acknowledged that further refinement of diagnosis codes considered as in-scope and out of scope for the model would be required.

IHPA undertook this refinement for AR-DRG V10.0 and in so doing expanded the guiding principles for exclusion as outlined in Table 1:

Table 1: Guiding principles for exclusion in the AR-DRG complexity model

Original (AR-DRG V8.0)	Additional (AR-DRG V10.0)
Codes for undefined or ill-specified conditions	Codes for asymptomatic or sub-clinical conditions e.g. latent conditions
Codes for symptoms and findings or transient conditions	Codes that represent markers of other diseases e.g. hypercholesterolaemia
Codes that provide additional or contextual information	Codes that represent minor conditions that do not generally result in an admitted acute episode of care
Most unacceptable principal diagnosis codes	Codes that represent an underlying cause of disease e.g. tobacco dependence/use

A comprehensive review of the current in-scope code set (12,559 codes) informed by the guiding principles was undertaken in consultation with a sub-group of clinicians from CCAG, the wider CCAG group and DTG to refine the code set. The results of this review also went out to public consultation during May/June 2018. Particular attention was also given to a review of those codes with a large increase in assignment between 2015-16 and 2016-17, coinciding with the introduction of AR-DRG V8.0 on 1 July 2016.

Impact analysis was then undertaken on the proposed diagnosis exclusions to determine which codes should potentially be reincorporated into the ECC Model. An iterative consultation process was conducted that included further analysis and consultation with CCAG, DTG and CAC, and the CCAG sub-group, which also took into consideration feedback from the public consultation.

A list of codes for exclusion was then finalised based on a combination of the impact analysis and clinical advice.

Of the 12,559 codes initially in-scope within the complexity model 1,576 were proposed for exclusion, decreasing the in-scope codes by approximately 12.5%. Following feedback from stakeholders, the impact analysis and further clinical advice from the CCAG sub-group the final

list excludes 1,511 codes (with 65 having been reincorporated), reducing the in-scope codes by approximately 12.0%.

3.2 Stability of the AR-DRG complexity model

The ECC Model provides a systematic method for refining complexity weights with each new version of AR-DRGs. Prior to this a systematic review of diagnosis complexity weights had not occurred since AR-DRG V4.0 was introduced in 2000. A primary benefit of the ECC Model is that it facilitates continual refinement of the model by utilising the most recent cost and activity data. This means that to some extent the model is ‘self-correcting’ and reflects changes in the underlying data. For example, a significant increase in the reporting of a specific diagnosis code may result in a reduction in the complexity weight with all else being equal. The ‘self-correcting’ nature of the model, however, needs to be balanced against stability. Stakeholders have an expectation that while AR-DRG versions should reflect changes in resource use they should at the same time remain reasonably stable.

In order to assess the overall AR-DRG classification stability, a number of levers in the ECC Model were considered:

- **DCLs:** The DCLs represent the relative costs associated with each diagnosis within the context of specific ADRGs. DCL weights are calculated for every combination of diagnosis and ADRG, resulting in approximately 6.7 million different combinations and range between zero and five.
- **Refinement in the number of complexity splits:** Introduction or removal of complexity splits within an ADRG, for example, an ADRG changing from having an ‘A’ and a ‘B’ DRG to having an ‘A’, ‘B’ and ‘C’ DRG.
- **Refinement of complexity thresholds:** Changes to the thresholds within an ADRG that determine which episodes are assigned to an ‘A’, ‘B’ or ‘C’ DRG.

Changes to any of these levers can result in movement of episodes between complexity levels within an ADRG. As part of the AR-DRG V10.0 development IHPA developed and adopted a number of stability measures to ensure the robustness and stability of the complexity model both for V10.0 and future versions of the AR-DRG classification. Table 2 outlines the stability measures that have been adopted for AR-DRG V10.0.

Table 2: AR-DRG complexity split stability measures

Area	Measure
<p>Stability of DCL weights</p>	<p>For AR-DRG V10.0 a stability criterion has been adopted when deriving the DCL weights. DCL weights are rounded integers between zero and five, therefore unrounded DCLs of 0.498 and 0.505 results in DCL weights of zero and one respectively. To avoid large shifts in rounded DCL weights, unrounded DCLs need to shift by more than ± 0.2 relative to the AR-DRG V9.0 DCL to warrant a change.</p>

Area	Measure
<p>Stability of complexity splits within ADRGs</p>	<p>Changing the number of splits within an ADRG needs to be considered carefully, especially taking into account the interval since the last modification. IHPA has further refined the splitting criteria to ensure there is a strong evidence base in the data before a split is introduced or removed.</p> <p>Both AR-DRG V8.0 and V9.0 were taken into consideration when assessing the number of splits. That is, if the number of splits has not changed between V8.0 and V9.0, there needed to be greater evidence (statistical or clinical) to warrant a change in V10.0.</p> <p>ADRGs with large movements of episodes between complexity groups were assessed on a case by case basis, to ensure all movements are understood and justified relative to AR-DRG V9.0.</p>
<p>Overall stability performance measure</p>	<p>The overall stability has been evaluated by reviewing the proportion of episodes shifting complexity within and outside ADRGs. This measure facilitates identification of large movements in episodes within the AR-DRG classification, following which a review can occur to ensure any such large movements are justified.</p>

3.3 Nephrolithiasis interventions

During AR-DRG V9.0 development a number of options were considered for combining or redefining the ADRGs for nephrolithiasis interventions with the aim of creating more clinically coherent groups for these interventions and removing the reliance on the sameday criterion. ADRGs under review were:

- L40 *Ureteroscopy*;
- L41 *Cystourethroscopy for Urinary Disorder, Sameday*;
- L42 *Extracorporeal Shock Wave (ESW) Lithotripsy*.

This work was not progressed in V9.0 mostly due to the movement of some high cost episodes into proposed new ADRGs that could not be resolved.

In reconsidering this issue for AR-DRG V10.0 an initial proposal was to create a new ADRG for nephrolithiasis interventions that combined the content of L40 and L41 and removed the sameday variable.

While data analysis supported the resource homogeneity of these new groupings it did result in some high cost episodes moving into the new ADRGs, the same issue that was encountered during V9.0 development. To mitigate this issue the intervention hierarchy was adjusted and certain principal diagnoses codes were excluded from informing the new ADRG L44 where they were clinically better represented by their original ADRGs.

This provided more clinically coherent groupings for nephrolithiasis interventions and removed the sameday variable that informed the former L41. The final outcome was to replace ADRGs L40, L41 and L42 with two new ADRGs:

- L43 *Nephrolithiasis Interventions*;
- L44 *Cystourethroscopy for Urinary Disorder*.

IHPA has not proposed changes to ADRGs L07 *Other Transurethral Procedures* or L08 *Urethral Procedures*, as they group interventions for nephrolithiasis of a more significant 'surgical' nature and a different cost profile to those in ADRGs L40, L41 and L42.

3.4 Removal of the rehabilitation ADRG

ADRG Z60 *Rehabilitation* became obsolete as a consequence of an update to an ACS implemented in Ninth Edition (1 July 2015). Rehabilitation episodes now group to various ADRGs according to a principal diagnosis that reflect the underlying condition requiring rehabilitation and so this ADRG has been removed in AR-DRG V10.0.

3.5 Liver procurement from a living donor

A public submission highlighted an inconsistency in the grouping of liver procurement from living donors. Episodes of care for living donor kidney procurement group to a body system MDC (MDC 11 *Diseases and Disorders of the Kidney and Urinary Tract*). In contrast, episodes of care for living donor liver procurement group to MDC 23 *Factors Influencing Health Status and Other Contacts with Health Services*, resulting in assignment to ADRG Z01 *Other Contacts with Health Services with General Interventions*.

In AR-DRG V10.0 episodes of liver procurement from living donors will group to ADRG H01 *Pancreas, Liver and Shunt Procedures* in MDC 07 *Diseases and Disorders of the Hepatobiliary System*. This grouping is more clinically coherent and consistent with the grouping of other living organ procurement episodes.

3.6 Osseointegration interventions

A public submission highlighted a discrepancy in the grouping of osseointegration procedures of the digits and limbs, whereby some episodes inappropriately group to ADRG I15 *Cranio-Facial Surgery*.

This has been amended in V10.0 and these episodes will now group more appropriately to ADRG I28 *Other Musculoskeletal Procedures*.

3.7 Intervention hierarchy review

Within each MDC in the AR-DRG classification episodes are allocated to an ADRG in a specific hierarchical order. The hierarchy of the intervention partition is important as episodes have the potential to meet multiple surgical and/or other ADRG criteria.

The intervention hierarchy is generally based on cost, with high cost ADRGs higher in the hierarchy. However, cost is not the only determinant. Other factors are also considered such as specific ADRGs being positioned higher than non-specific ADRGs and treatment intervention ADRGs being positioned higher than diagnostic intervention ADRGs.

Changes to the partitioning of the AR-DRG classification in AR-DRG V9.0 resulted in a single 'intervention' partition by combining the former 'other' and 'surgical' partitions. Additionally V9.0 saw a number of changes with respect to revision of Pre-MDC ADRGs and those using Pre-MDC reassignment logic.

A hierarchy review to assess the impact of the partition modification and the Pre-MDC revision was not performed during V9.0 development; however, has been undertaken for AR-DRG V10.0.

Building on principles used in previous AR-DRG versions IHPA developed criteria that were used to assess and inform changes to the hierarchy for AR-DRG V10.0. These criteria are outlined in Table 3.

Table 3: Intervention hierarchy criteria

Criteria	Description
Cost	Sorting of intervention ADRGs from high to low cost with decisions based on both mean and median cost.
Specificity	Sorting of intervention ADRGs from specific to non-specific ADRGs (the most common of these are the other/catch-all ADRGs at the bottom of the intervention hierarchy, just before ADRG 801 <i>General Interventions (GIs) Unrelated to Principal Diagnosis</i>). This criterion may override the cost criterion.
Procedure type	Sorting of intervention ADRGs from the initial definitive intervention, to follow-up and supportive interventions and from major to minor/other interventions.
Treatment type	Sorting of intervention ADRGs from treatment to diagnostic interventions.

With the introduction of new ADRGs and/or modification to ADRG logic it is necessary to re-assess the ADRG intervention hierarchy to ensure that changes are appropriately accounted for within the intervention hierarchy.

The intervention hierarchy review for V10.0 resulted in hierarchy position changes to eleven of the 25 MDCs. The AR-DRG V10.0 Technical Specifications provide further details as to the methodology and outcomes of the intervention hierarchy review for AR-DRG V10.0.

3.8 ADRG splitting criteria review

An episode of care is initially assigned to an ADRG which broadly group episodes with the same diagnosis and intervention profiles. The final stage is to subdivide (or 'split') each ADRG into individual DRGs based on the ECCS and occasionally other factors such as length of stay and transfer status. Splitting criteria are used to determine when a complexity split is warranted within an ADRG. In AR-DRG V10.0 the ADRG splitting criteria remains largely unchanged relative to V9.0, apart from the introduction of a new criterion that assesses the appropriateness of the episode complexity profiles within an ADRG.

This new criterion requires an inverse trend between sample size and complexity level to incorporate a clinical coherence principle within the splitting methodology; with the expectation the more complex DRG would have a smaller proportion of episodes. These criteria are expected to be met for the majority of the ADRGs. While it is optimal that all splitting criteria are met there are some exceptions where ADRGs have been split without satisfying all criteria. Table 4 outlines the criteria used for splitting ADRGs in V10.0.

Table 4: AR-DRG V10.0 splitting criteria

Criteria	Optimum threshold
1 Minimum episodes per category 200 per year	✓
2 Minimum cost per category \$1m per year	✓
3 Minimum percentage per category 10 percent per year	✓
4 Minimum absolute change in mean cost between consecutive categories \$3,700	Either criterion 4 or criterion 5
5 Minimum relative change in mean cost between consecutive categories 2*	
6 Inverse trend between sample size and complexity level	✓

*The increase in the cost of a category needs to be, as a minimum, twice as much e.g. if the cost of a category is \$3,000 the increase in cost needs to be at least \$6,000.

IHPA reviewed all the ADRG complexity splits for AR-DRG V10.0 following the principles outlined above, the outcome of which is detailed in Table 5.

Table 5: ADRG splitting profile for V9.0 and V10.0

Number of splits	AR-DRG V9.0	AR-DRG V10.0
0 (Z)	87	87
1 (A,B)	225	227
2 (A, B, C)	82	78
3 (A, B, C, D)	5	5
Total	399	397

Of the 397 ADRGs in V10.0 the majority (57%) have one split (A, B). Of these, 395 are directly comparable to V9.0. Table 6 provides a summary of these comparable ADRGs.

Table 6: Comparable ADRGs by number of splits in V9.0 and V10.0

Number of splits		AR-DRG V9.0				
		0	1	2	3	Total
AR-DRG V10.0	0	81	6	0	0	87
	1	3	215	7	0	225
	2	0	3	75	0	78
	3	0	0	0	5	5
	Total	84	224	82	5	395

Of the 395 comparable ADRGs, 376 have the same number of splits as in V9.0. Of the 19 that have changed six have an increased number of splits and 13 have seen a decrease in the number of splits.

4 AR-DRG V10.0 Overview

4.1 ADRG Structure

In AR-DRG V10.0 there are a total of 397 ADRGs, with two new ADRGs and four ADRGs having been removed as outlined in Table 7.

Table 7: New and removed ADRGs

New/Removed	ADRG	Description
New ADRGs	L43	Nephrolithiasis Interventions
	L44	Cystourethroscopy for Urinary Disorder
Removed ADRGs	L40	Ureteroscopy
	L41	Cystourethroscopy for Urinary Disorder, Sameday
	L42	ESW Lithotripsy
	Z60	Rehabilitation

Overall there is a decrease in the total number of ADRGs from 399 in V9.0 to 397 in V10.0.

4.2 Statistical Performance

The performance of the AR-DRG classification has historically been measured using the Reduction in Deviance (RID) statistic. RID measures how much of the variability in cost is explained by the AR-DRG classification and is expressed as a percentage. The higher the percentage value, the higher percentage of cost variation is explained by the system.

The overall statistical performance of AR-DRG V10.0 as measured by the RID statistic is 64.6% which is comparable with an RID of 65.2% in AR-DRG V9.0. The change in the overall statistical performance is within expectations given the AR-DRG V10.0 refinement was primarily driven by clinical coherence principles, in particular the diagnosis exclusion review.

Appendix A: AR-DRG V10.0 Descriptions
